Setup An E-shop…DOGECOIN STYLE:

Hopefully you're excited because I am…We'll do this slow and steady…asking you a string of questions before guiding you down the path you need to take…clear??? Let's begin…

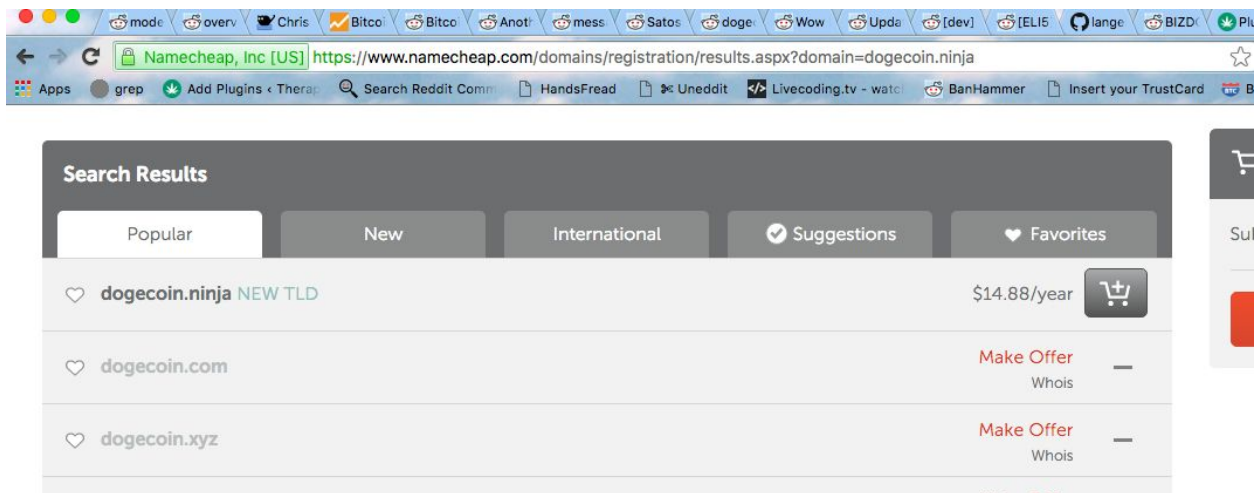

Much Wow Such Moon Payments!

Do you know what Doge is? Yes?!? Then you're already halfway there Shibe! Good! Now we begin by picking a wallet: Choose any two: Fast, Secure, Expansive. Ready? Now if you Picked Secure and Fast: DogeTipBot, Secure and Expansive?: Dogecoin Core, Expansive and Fast: MultiDoge. Get it got it good…now we figure out your kick ass shibash business plan. So this boils down to yer two terms mate: ye be goodman or serviceman er both of course. The biggest and the best do both with much wow such amaze. So picketh ye what ye be shibe – I sell bumper stickers on honeybadgerofmoney as well as other trinkets. But should you choose to sell ebooks or Artwork, I can show you how to do that as well. There are different approaches and methods so in this guide today we'll be discussing how to setup an e-shop, get a domain name going (paid for using crypto) and even how to get the site up and rolling on the cheap cheap! To follow this guide effectively plan to spend about $25 dollars and have an afternoon or weekend to spare to get this idea from concept to reality. So now if your gears have been turning you have this 10 Billion Doge idea in the midst…get it written down… ideally you will revisit this scibble or jot often. ..perhaps once a week is

best to ensure that you are following through to meeting your objectives. My objective for the purposes of this tutorial is to sell this guide as an ebook, to sell one hour of my consulting/development time as a service item, and finally, to sell my famous fry seasoning – All from the same storefront. This entire guide will walk you through all the steps I took to get this up and running.

Step 1:

Pick you kickass sweet business idea! Now pick the name short wins. Use Namecheap – They offer domain names for Bitcoin meaning they're a crypto-progressive company. I see dogecoin.ninja – Perfect…let's grab it!

..Now add on Value shared hosting – you can expand up to three websites should you choose to….the entire cart price of this setup so far should total you … that's right … a mere $24.95 shine, with a nickel for your thoughts (or to hand off to me should you choose 😉 Now I was going to initially introduce you to the wordpress route and that is still the aim and intention of this guide but I want you to know that you are BY NO MEANS LIMITED TO THE PUNY WEAKLING THAT IS WORDPRESS!!!!! should you be the website developer juggernaut that uttered this last sentence you have the power of such content management systems such as Drupal, Joomla, Prestashop, or even Magento. Use Gourl.io. It gives you the advantage of integrating into any of those storefronts so that you have more flexibility in the solution you choose (with no headache). However, for the

purposes and scope of this guide, we'll stick with the safe route that assumes you have zero knowledge of programming nor care to learn it. We'll spoon feed you through this…Have you purchased the domain name and hosting combo yet???

Step 2:

Installing WordPress. Once you have hosting and the domain purchased they should be linked together by default (as they are part of the same package). Login and choose One-Click Install. From here you should be taken to the Scriptalicious Portal. From there you can install wordpress for your site. Pat yourself on the back because you're three quarters done! For the display example we'll be installing the storefront onto my existing domain name. To visit simply check out doge.honeybadgerofmoney.com! To install wordpress onto your domain, simply enter in an email address and a username. Your password will be emailed to this address so be sure it is one you own and can secure! Just having a Gmail Account along isn't going to cut it – Preferably, you should have an email address that is already configured. Luckily, Namecheap provides Email Accounts for Domains through your Cpanel Dashboard. Login to the hosting interface then click Email Accounts…from there you can generate a personalized email such as admin or support or fancysupershibe@dogecoin.ninja (if you're smart and bought this by now) and be sure to set a complex password. Now you can look like a professional and use something fancy such as thunderbird or Clawsmail – Both are free so do yourself a favor and look professional with an email address from your domain!

Step 3:

Install plugins – These are mandatory: Woocommerce, Gourl.io Payment Gateway, and CoinGecko Price Ticker Widget (<img alt="dogecoin price" src="https://www.coingecko.com/en/widget_component/ticker/dogecoin/usd.jpg">) <- Thank CoinGecko for this ticker tool BTW…use it to display the current doge price on your site. I just plopped it into my shop page on wordpress. The difference between pages and posts – posts are temporary in time and should be used for blog posts … pages are permanent and should be linked to like category pages or perhaps permanent pages you wish to always point to – menu placeholders. Even though Posts can be linked to and used like pages, permanent style content should be placed into pages, now moving on. Take the time to do the woocommerce tutorial and walkthrough – create the checkout my-account and other pages that woocommerce depends upon to function smoothly and from there take the time to setup a few products – go on try it! It's very easy to duplicate a base product to create different styles – OR – create a variation product so that you could allow your customers to select variations of sizes or colors, ideal for clothing or selling in specified quantities. See the videes here:

Video Pt 1: http://recordit.co/534NVKok0b
Video pt 2: http://recordit.co/8yujkoSYCe

I didn't finish it through but you can see by the result that we required the price to be place there NOT necessarily an inventory level – I wish they would have that automatically placed based on my sale price!!! hmpph…anyhow….

Step 4:

Choose A Coin Processor – Why do you want a coin-processor? A coin-processor will take no setup and usually has an integrated plugin to configure directly into your wordpress site! To really be underground and not rely on a 3rd party, you have the option of setting up your own Dogecoin RPC daemon to listen in on and respond with fresh addresses for payments or you could potentially generate thousands of addresses at once and upload them to your related database to be used for generated invoices within woo commerce (this is out of scope for today's guide but can be certainly

implemented with a bit of php and patience!) OR just give some trust and do some due diligence to pick a merchant processor, pay perhaps 1-3% and skip the headache. To date I've configured CryptoWoo, Gourl.io, coinpayments.net and today gocoin.com. I spent the initial time today with Gocoin.com …Avoid them unless you want much pain and suffering. Go with Cryptowoo if you have already used coinpyments and gourl.io and wish to look for something new as its fairly young but designed to be dev friendly. If you don't know what to do and just bought this domain on my whim and need me to get this finished already so you can take over teh world, you definitely need to roll with Gourl.io Setup an account using this link. Once registered you should have a basic dashboard page where you can generate your Private and public API Keys for Doge like this:

 http://recordit.co/82zbFNSHZO

Can't Doge it…need both plugins for it to much amaze
Now install the plugins (there's two required for Gourl to function properly, a main gateway plugin and a woocommerce wrapper). To install plugins, simply hover your mouse on plugins (looks like a plug icon) and then click on "Add New" to search for gourl and to add these two icons to the left here. Once thye are installed you can enter in your generated key info into your Plugin settings page here (replacing it with your moon approved domain name www thingy of dogeness): http://dogecoin.ninja/wp-admin/admin.php?page=gourlsettings.

Moment of Proof:

the received free GoUrl Paycoin Box Public/Private Keys. Leave field blank if you do not accept payments in Paycoin

Dogecoin Payments:

Dogecoin

GoUrl Dogecoin Box Public Key -

Wam

GoUrl Dogecoin Box Private Key -

Bam

That is not a Dogecoin wallet private key! *GoUrl Dogecoin Box Private/Public Keys are used for communicating between your website and GoUrl.io Payment Gateway server (similar like paypal id/keys).*
If you want to start accepting payments in Dogecoin (DOGE), please create a Dogecoin Payment Box on GoUrl.io and then enter the received free GoUrl Dogecoin Box Public/Private Keys. Leave field blank if you do not accept payments in Dogecoin

"Eureka Shibe Genius"

Step 5:

?????????????? – Seriously IDHAFC on how you make your 60 billion double doges but at least we now have a website by which we can collect them!!!! So now its on you to market your wares to /r/dogecoin, forum.dogecoin.com, doges.com, suchlist.com and any other possible marketing avenue I may have missed. We're in the buizness to stay in business so now you should be ready to rinse and repeat for three more domains with another $20 and potentially have three different businesses in motion. Now…if you are looking to do development or website work and want to have other capabilities I would advise considering other hosting options beyond namecheap as there are opportunities to save in the long run with a little bit of research…your results may vary.
